Impact of English instruction on labor market outcomes

The case of Mexico

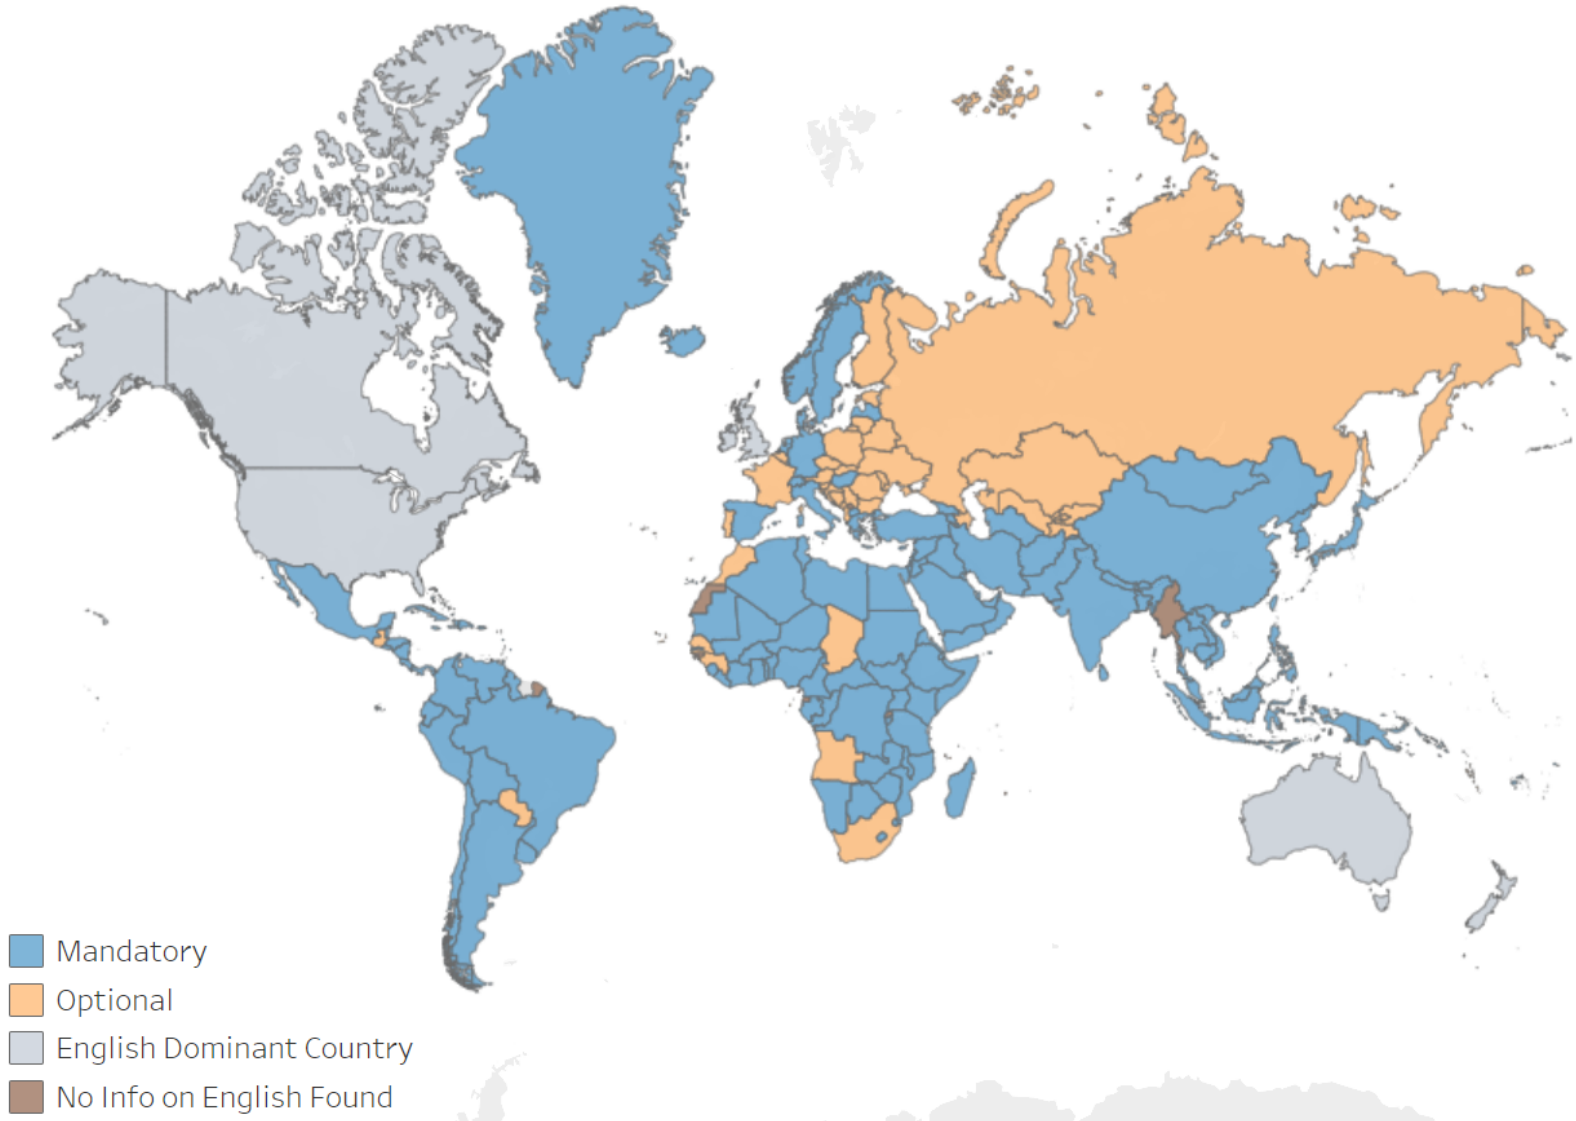
Oscar Galvez-Soriano

University of Houston

Department of Economics

October 2022

Motivation: Global English education policy



Source: Ives, P., Bale, J., and Haque, E. (2020). How States Promote Global English: Shifting Priorities in Education Policy. Social Sciences and Humanities Research Council of Canada.

Motivation

The value of English language skills in developing non-English speaking countries

- Globalization: trade and culture (internet, news, social media, etc.)
- Migration and labor market outcomes

I will study the expansion of English instruction in Mexico

Related Literature

- Returns to English language skills
  - In English-speaking countries: Bleakley and Chin (2004); Chiswick and Miller (2015)
  - In non English-speaking countries: Lang and Siniver (2009); Azam, Chin and Prakash (2013)

- English instruction in schools
  - Policy change in the medium of instruction: Angrist, Chin and Godoy (2008); Eriksson (2014)
  - Exposure to English instruction as a subject: Chakraborty and Bakshi (2016)

I study English instruction as a subject in Mexican public primary schools

Main contributions of this paper

Research Question

- What is the effect of exposure to English instruction on labor market outcomes in a non-English speaking country?

Empirical strategy

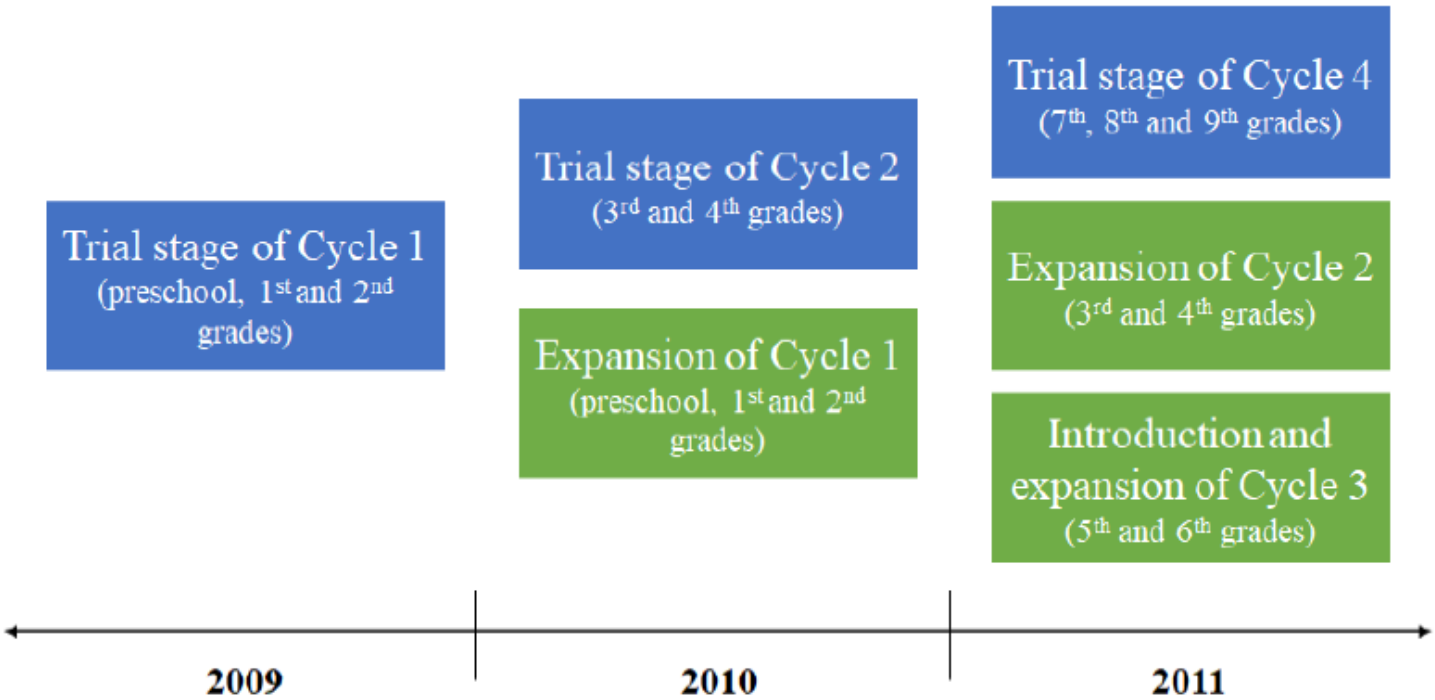
- Variation in exposure driven by a policy change in Mexico
- Rich data connecting individuals in primary school to their labor market outcomes
- Use school by cohort variation in exposure to English instruction in Mexican primary schools

Policy background

National English Program in Basic Education (NEPBE) launched in 2009 in Mexico

- Introduced English instruction in public primary schools
- Funded by the central government
- Implemented gradually

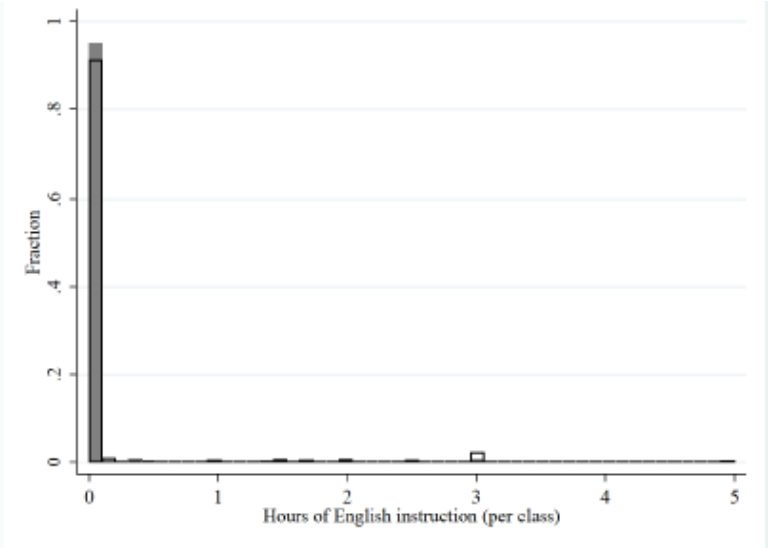
Policy background: English program stages



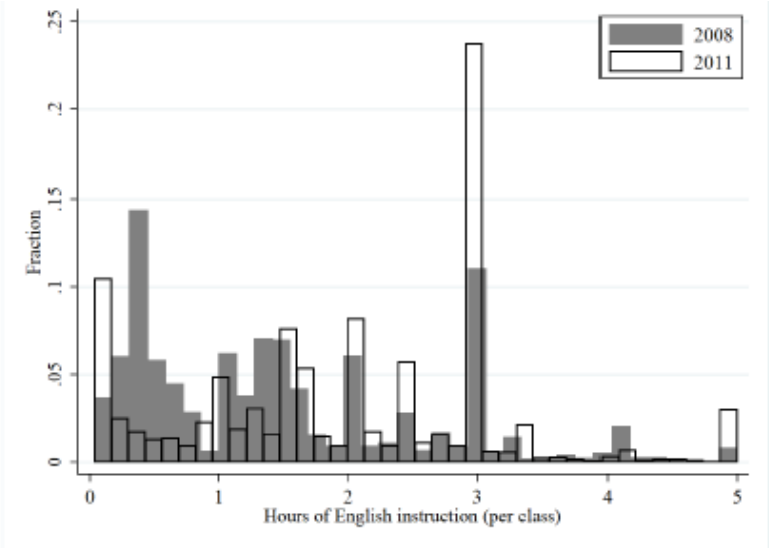
Note: NEPBE was launched in 2009 as a trial stage with the called Cycle 1. In 2010 the program continued the trial stage with the Cycle 2 and expanded Cycle 1. Finally, in 2011 the program introduced for the first time and expanded Cycle 3, benefiting fifth and sixth graders.

▸▸ data

Policy background: Distribution of hours of English instruction (2008 vs 2011)



(a) Hours of English instruction



(b) Hours of English instruction (w/o zeros)

Note: Density of the indicated variables are plotted. Histograms at the right do not show zeros, which capture most of the distribution. Hours of English instruction are calculated dividing total hours in a school by total number of classes. Similarly, number of English teachers are calculated dividing total number of English teachers by total number of classes in a school.

Hours of Eng

Empirical strategy

- Challenging to estimate the effect of exposure to English instruction on labor market outcomes
- Key concern: schools that offered English instruction are systematically different from those that did not
  - Likely to have positive selection bias, e.g., schools offering English instruction located in richer neighborhoods
- I address this by using a school FE approach
  - Data of the universe of primary school students, able to connect to their labor market outcomes
  - Intuition: compare students from the same school, some with more English instruction and some with less

Measure of exposure to English instruction

Cohort	Primary school					
	1st	2nd	3rd	4th	5th	6th
1997	2003	2004	2005	2006	2007	2008
1998	2004	2005	2006	2007	2008	2009
1999	2005	2006	2007	2008	2009	2010
2000	2006	2007	2008	2009	2010	2011
2001	2007	2008	2009	2010	2011	2012
2002	2008	2009	2010	2011	2012	2013

- Using the Mexican school census, I calculate weekly hours of English instruction (per class), for each school-year
- For each school-cohort, I average the hours of English instruction from 1st to 6th grade
  - I assume students enter school at age 6 and had normal progression until grade 6th

Impact on labor market outcomes

I estimate the following equation to get the effect of exposure to English instruction on labor market outcomes:

$$y_{isc} = \alpha + \beta \cdot ExpEng_{sc} + \boldsymbol{X_{isc}\gamma} + \zeta_c + \nu_s + \tau_t + \varepsilon_{isc}$$

where y_{isc} is the labor market outcome of individual i, who attended school s and belongs to cohort c

Mechanisms

Potential mechanisms of the effect of exposure to English instruction on labor market outcomes:

- English language abilities
- Other skills
  - Language (Spanish)
  - Mathematics
- Jobs requiring English skills

Data

I use three main sources of data:

- Social Security data (2018-2021)
  - Worker level
  - Formal sector
  - Individuals between 16-25 years old
- ENLACE (2006-2013): Nationwide test (Math and Language)
  - Student level
  - From 3rd to 6th grade
- Mexican school census (2003-2013)
  - School level
  - School characteristics: weekly hours of English instruction

Data: Labor market outcomes

I investigate the effect of exposure to English instruction on four main labor market outcomes:

1. Probability of working in formal sector
   - Dummy for being in social security data among the universe of students
2. Wages (average monthly wage)
3. Geographical mobility (distance from home county to working county)
4. Economic industries (NAICS) codes

Estimation results: sample selection

Table 2: Exposure to English instruction and labor market outcomes (Social Security data)

	(1) In SS Data	(2) ln(wage)	(3) ln(distance)	(4) Move State
Panel A: Full sample				
Hrs English	-0.013***	-0.015***	-0.035***	-0.004***
	(0.001)	(0.002)	(0.008)	(0.001)
Observations	16,938,183	4,055,434	4,055,434	4,055,434
Adjusted R^2	0.105	0.270	0.477	0.555

- Concern about selection into social security data
- Possibly because individuals are still enrolled in school
- Use counties where it is less likely that they are enrolled

▸▸ Statuses

Proposed solution: Construction of low-enrollment sample

1. Using the 2020 Mexican Population Census, I construct a county-enrollment rate variable
    - Enrollment rates in first year of college (2002 cohort)
2. I keep the data with 38 percent (or less) of individuals enrolled in school

Exploring mechanisms

- Mechanism 1: English abilities
  - Exploiting the implementation of state English programs before the NEPBE
  - Galvez-Soriano (2022) shows that exposure to English instruction increases the acquisition of English skills
- Mechanism 2: Cognitive abilities
  - Test score data
- Mechanism 3: Jobs requiring English skills
  - Social security data

Mechanism 2: Cognitive abilities

Effect of exposure to English instruction on student achievement:

$$test\_score_{isc} = \theta + \phi \cdot ExpEng_{sc} + \boldsymbol{X_{isc}\gamma} + \zeta_c + \nu_s + \varepsilon_{isc}$$

where $test\_score_{isct}$ is the 6th grade test score of student i, who attended school s and belongs to cohort c

Data

Estimation results: exposure to Eng and test scores

Mechanism 3: Are workers moving to jobs requiring English abilities?

- Mexican Subjective Well-being Survey (BIARE) has information of English abilities in 2014
- Using BIARE, I construct an index of English skills by economic industries
  - These industries are classified according to the North American Industry Classification System (NAICS) at four-digit code
- I classify industries in "high English" and "low English" intensive jobs

Estimation results: industries requiring English skills

Manu Ind Svcs Ind

Takeaway

- Exposure to English instruction
  - Does not have an overall effect on wages
  - But may have positive returns among high ability individuals
  - Increases women's mobility, because they are moving from agriculture to manufacturing industries
- Results on labor market outcomes could be explained for the acquisition of English skills
  - Evidence from previous state English programs (Galvez-Soriano, 2022)
  - No effect on other cognitive skills
- Exposure increases the likelihood to choose jobs in industries requiring English abilities

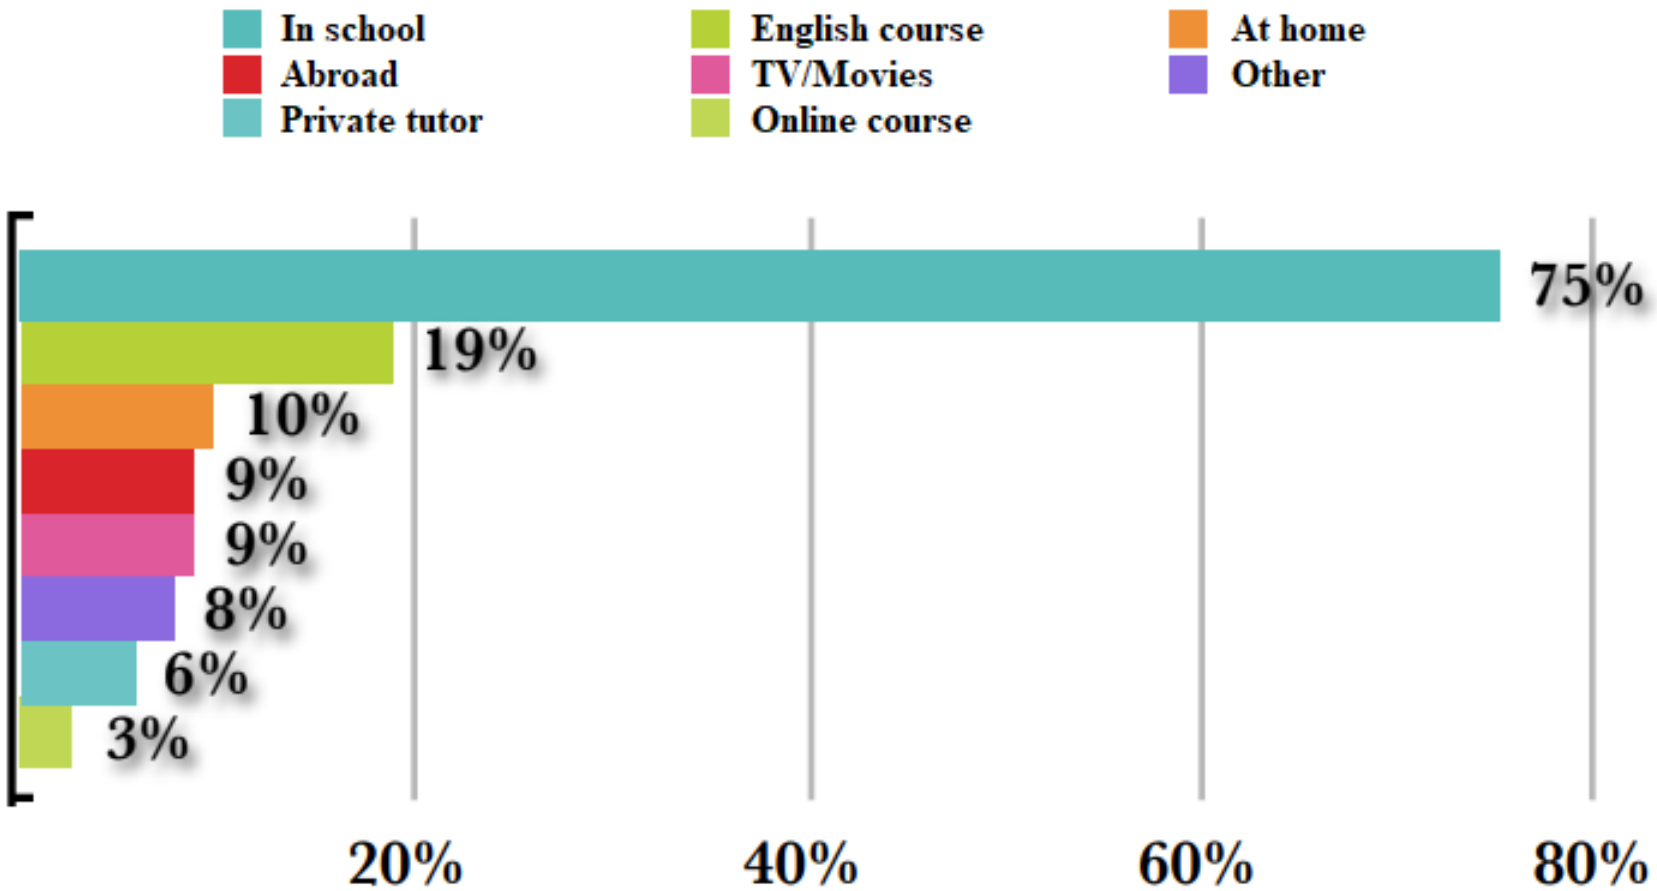
Measuring hours of English instruction

Benito Juarez Elementary School

Weekly hours of English instruction	18
Number of classes	6
Hours of English instruction (per class)	3

⏩ Eng over time ⏩ Data

Where did you learn English?



Note: This question was answered only by individuals who reported having English abilities. The answers are independent, i.e. do not sum 100 percent.

NAICS codes in my classification

Industries	NAICS code	Industry Title
Agriculture	11	Agriculture, Forestry, Fishing and Hunting
Construction	21	Mining
	22	Utilities
	23	Construction
Manufacturing	31-33	Manufacturing
Services	42	Wholesale Trade
	44-45	Retail Trade
	48-49	Transportation and Warehousing
	51	Information
	52	Finance and Insurance
	53	Real Estate Rental and Leasing
	54	Professional, Scientific, and Technical Services
	55	Management of Companies and Enterprises
	56	Administrative and Support and Waste Management
	61	Educational Services
	62	Health Care and Social Assistance
	71	Arts, Entertainment, and Recreation
	72	Accommodation and Food Services
	81	Other Services (except Public Administration)
	92	Public Administration

Labor market outcomes

Data: Student achievement

1. I look at test scores as one of the mechanisms
2. I standardize test scores, ts_{isct}, of each student i in school s at time t using the following formula:

$$test\_score_{ist} = \frac{ts_{isct} - \mu_t}{\sigma_t}$$

where $test\_score_{ist}$ is the standardized test score, while μ_t and σ_t are the mean and standard deviation of test scores, respectively, pooling all Mexican students by grade and by each observed year

Estimation results: exposure to Eng and test scores

Table 7: Exposure to English instruction and student achievement

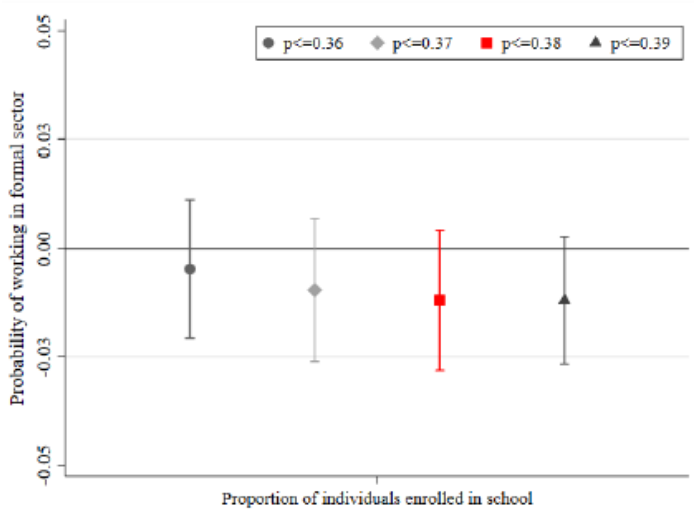
	(1) Language 6th	(2) Language 6th	(3) Math 6th	(4) Math 6th
Panel A: Full sample in ENLACE database				
Hrs English	0.0335***	0.0099*	0.0155***	-0.0081
	(0.0033)	(0.0054)	(0.0036)	(0.0062)
Observations	16,938,183	16,938,183	16,938,183	16,938,183
Adjusted R^2	0.426	0.472	0.429	0.482
Panel B: Full sample in Social Security data				
Hrs English	0.0284***	-0.0015	0.0105***	-0.0225***
	(0.0033)	(0.0075)	(0.0037)	(0.0086)
Observations	4,055,434	4,055,434	4,055,434	4,055,434
Adjusted R^2	0.404	0.453	0.413	0.470

Robustness Checks: different exposure variable

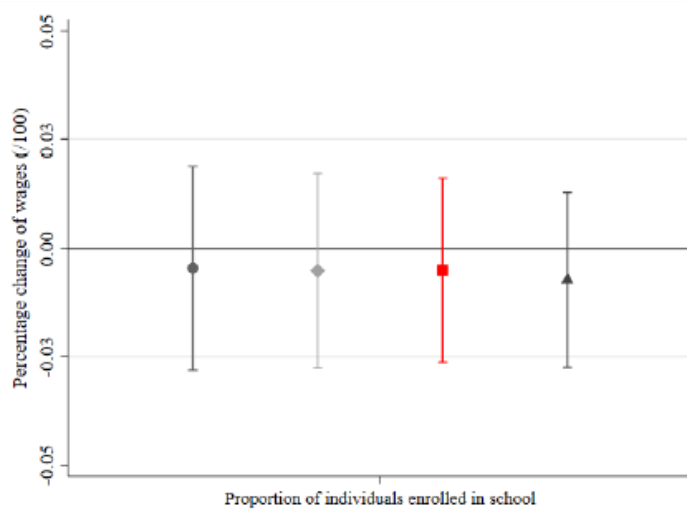
Table 8: English instruction and labor market outcomes (Alternative exposure variable)

	(1) In SS Data	(2) ln(wage)	(3) ln(distance)	(4) Move State
Panel B: Low enrollment sample				
Eng Teachers	-0.202*	-0.127	-0.772	0.072*
	(0.120)	(0.196)	(0.751)	(0.040)
Observations	1,554,827	259,666	259,666	259,666
Adjusted R^2	0.123	0.312	0.677	0.727
Panel C: Low enrollment sample (Men)				
Eng Teachers (β^M)	-0.140	-0.290	-1.644*	-0.086
	(0.173)	(0.294)	(0.983)	(0.226)
Observations	750,812	166,165	166,165	166,165
Adjusted R^2	0.149	0.315	0.680	0.729
Panel D: Low enrollment sample (Women)				
Eng Teachers (β^W)	-0.273*	0.078	0.866	0.295*
	(0.149)	(0.306)	(1.106)	(0.169)
Observations	804,015	93,501	93,501	93,501
Adjusted R^2	0.107	0.363	0.700	0.756
$\beta^M = \beta^W$ [p-value]	[0.023]	[0.757]	[0.083]	[0.084]
State of work FE	NO	YES	YES	YES

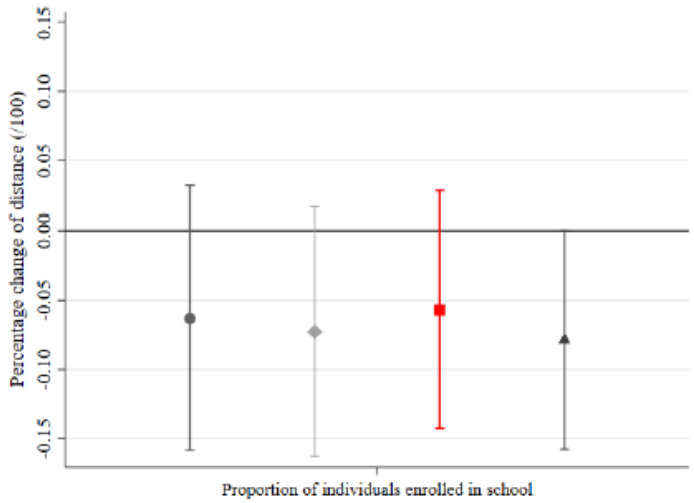
Robustness Checks: solution to sample selection



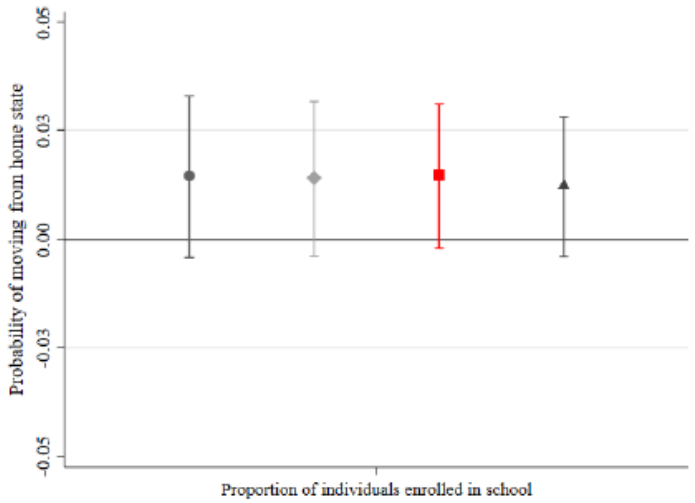
(a) Formal sector



(b) Ln(monthly wage)

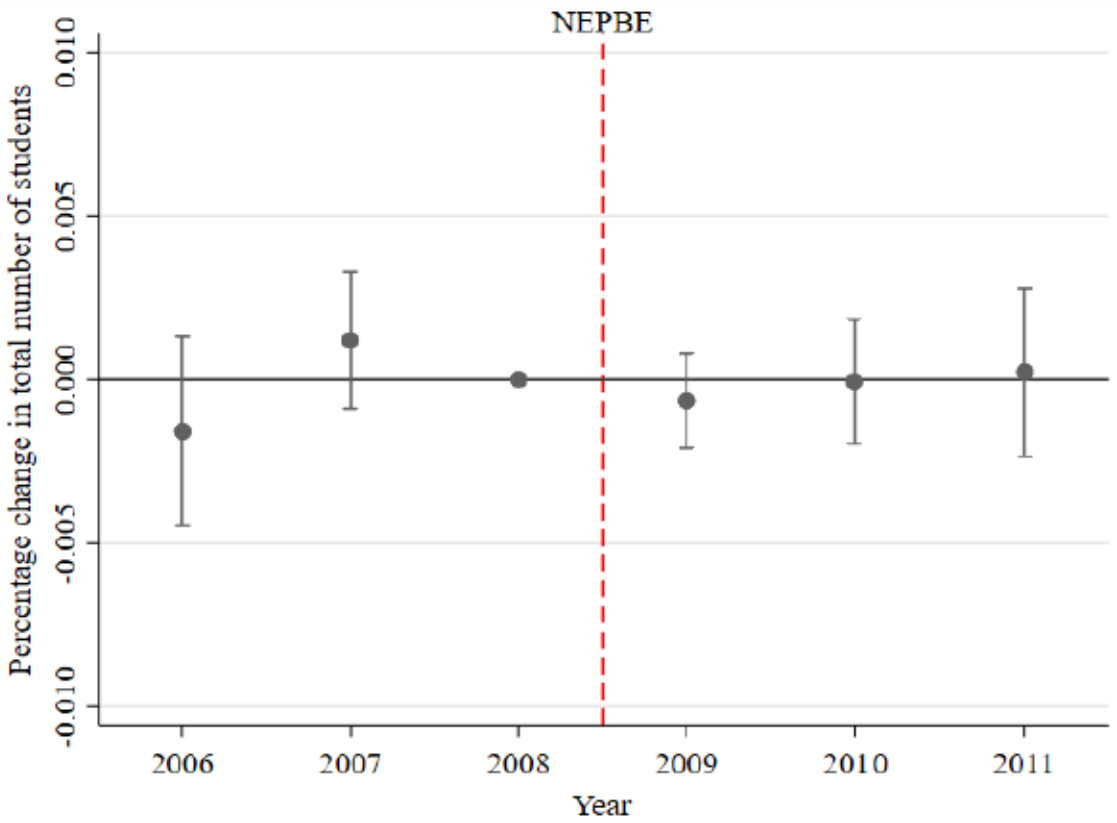


(c) Distance home-job county

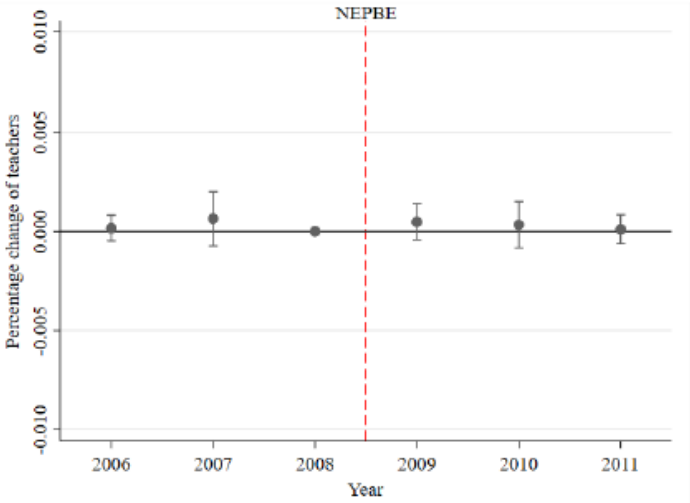


(d) Moves from home county

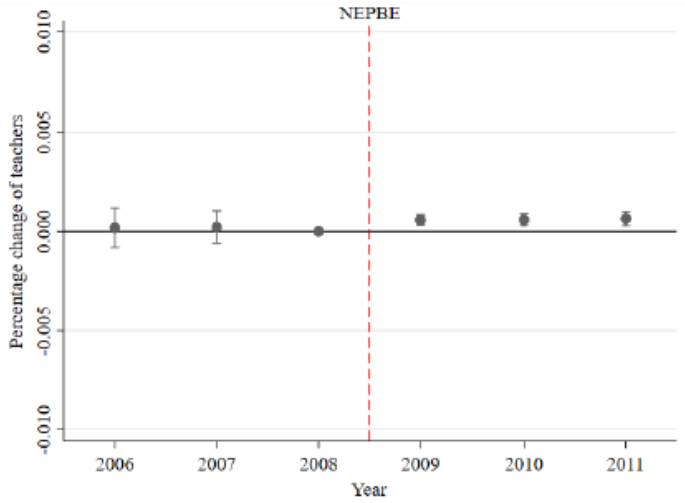
Robustness Checks: no-changes in private school enrollment



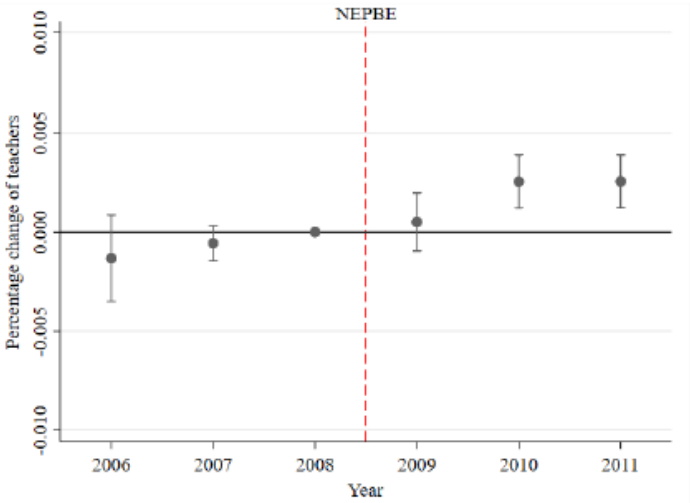
Robustness Checks: changes in number of teachers



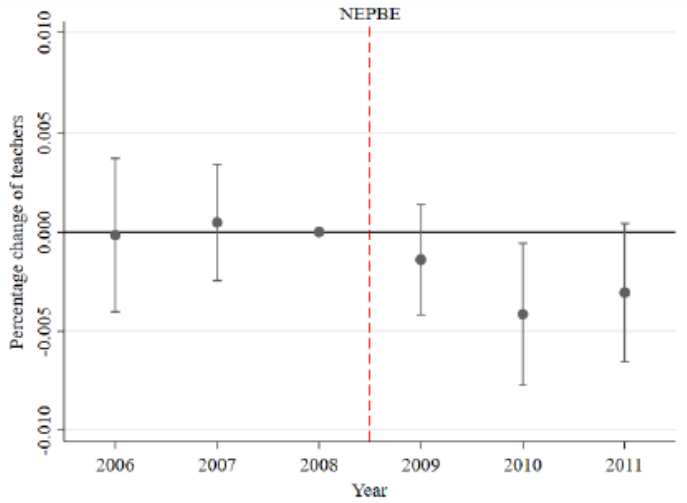
(a) With elementary school



(b) With middle school



(c) With high school



(d) With college degree
