

Impact of English instruction on labor market outcomes

The case of Mexico

Oscar Galvez-Soriano

University of Houston
Department of Economics

February 2023

Motivation

The value of English language skills in non-English speaking countries

- Globalization: trade and culture (internet, news, social media, etc.)
- Mobility and labor market outcomes

I will study the expansion of English instruction in Mexico

Policy background

National English Program in Basic Education (NEPBE)
launched in 2009 in Mexico

- Introduced English instruction in public primary schools
- Funded by the central government
- Implemented gradually

○○○○○○●

00

000000

○○

► Proportion of schools

Human capital framework

How might English instruction in primary school affect labor market outcomes?

- English language skills
 - Expand the set of jobs individuals can get
 - Possible complementarity with cognitive skills
- Other skills
 - Reduces time on other subjects or school activities
 - Possible complementarities with other subjects

Empirical strategy

- Challenging to estimate the effect of exposure to English instruction on labor market outcomes
- Key concern: schools that offered English instruction are systematically different from those that did not
 - Likely to have positive selection bias, e.g., schools offering English instruction located in richer neighborhoods
- I address this by using a school FE approach
 - Intuition: compare students from the same school, some with more English instruction and some with less
 - Data of the universe of primary school students, able to connect to their labor market outcomes

Impact on labor market outcomes

I estimate the following equation to get the effect of exposure to English instruction on labor market outcomes:

$$y_{isc} = \alpha + \beta \cdot ExpEng_{sc} + \mathbf{X}_{isc}\boldsymbol{\gamma} + \zeta_c + \nu_s + \tau_t + \varepsilon_{isc}$$

where y_{isc} is the labor market outcome of individual i , who attended school s and belongs to cohort c

» Descriptive

Data

I construct a unique data set connecting restricted-use administrative data of students and their labor market outcomes for birth cohorts 1997-2002

- ENLACE (2006-2013): universe of primary school students
 - I know what school they attended
 - Reading and mathematics test scores
- Mexican school census (2003-2013)
 - School characteristics: weekly hours of English instruction
- Social Security data (2018-2021)
 - I use individual ID to match students to their labor market outcomes
 - Formal sector
 - Individuals between 16-24 years old

Data: Labor market outcomes

I investigate the effect of exposure to English instruction on four main labor market outcomes:

- ① Works in formal sector
 - Dummy for being in social security data among the universe of students
- ② Wages (average monthly wage) [▶ IMSS](#)
- ③ Geographical mobility
 - Distance from home to working county
 - Moving from home state
- ④ Industries (NAICS) [▶ codes](#)
 - Dummies for agriculture, construction, manufacturing and services industries

Estimation results: Sample selection

Table 2: Exposure to English instruction and labor market outcomes (Social Security data)

	(1) Formal sector	(2) ln(wage)	(3) ln(distance)	(4) Move state
<i>Panel A: Full sample</i>				
Hrs English	-0.013*** (0.001)	-0.015*** (0.002)	-0.035*** (0.008)	-0.004*** (0.001)
Observations	16,938,183	4,055,434	4,055,434	4,055,434
Adjusted R^2	0.105	0.270	0.477	0.555

- Concern about selection into social security data
- Possibly because individuals are still enrolled in school
- Use counties where it is less likely that they are enrolled

►► Statuses

▶▶ Test scores

Proposed solution: Construction of low-enrollment sample

- ① Using the 2020 Mexican Population Census, I construct a county-enrollment rate variable
 - Enrollment rates in first year of college (2002 cohort)
- ② I keep the data with 38 percent (or less) of individuals enrolled in school
- ③ The low-enrollment sample represents 6.4% of the full sample

Adjusted R^2	0.402	0.388	0.342	0.292
Mean of dep. var.	0.11	0.16	0.39	0.34

We observe shifts across industries (consistent with more mobility). Implications and potential causes:

- Different career path
- More employment opportunities?
- Individuals perceive a broader choice set?

Exploring mechanisms

- Mechanism 1: English abilities
 - I cannot test directly this mechanism because my data set does not have a measure of English abilities
 - Evidence I will show:
 - **a** Galvez-Soriano (2023) shows that exposure to English instruction in primary school increases the probability of speaking English
 - **b** Workers are systematically moving to economic industries requiring English abilities
- Mechanism 2: Other cognitive abilities
 - Language (Spanish)
 - Mathematics

Mechanism 2: Cognitive abilities

Effect of exposure to English instruction on student achievement:

$$test_score_{isc} = \theta + \phi \cdot ExpEng_{sc} + \mathbf{X}_{isc}\boldsymbol{\gamma} + \zeta_c + \nu_s + \varepsilon_{isc}$$

where $test_score_{isc}$ is the 6th grade test score of student i , who attended school s and belongs to cohort c

» Data

Mechanism 2: Cognitive abilities ► Full sample

Table 7: Exposure to English instruction
and student achievement

	(1)	(2)
	Language 6th	Math 6th
<i>Low enrollment sample</i>		
Hrs English	0.0476 (0.0470)	0.0094 (0.0344)
Observations	259,666	259,666
Adjusted R^2	0.351	0.381

- Exposure to English instruction does not affect other cognitive abilities
- English skills?
- Industries requiring English skills?

Mechanism 1a: English abilities (Galvez-Soriano, 2023)

Data

- I use the 2014 Subjective Well-being Survey (BIARE)
- Representative at national and state level
- Asks if the respondent speaks English
- Only 3% reported they speak English

Empirical strategy

Take advantage of state policy changes in English instruction

$$y_{isc} = \theta + \psi \cdot HadPolicy_{sc} + \delta_s + \kappa_c + \mathbf{X}_{isc}\Psi + \varepsilon_{isc}$$

where $HadPolicy_{sc}$ takes the value of one if individual i lives in a treated state and he/she belongs to one of the affected cohorts (zero otherwise)

Mechanism 1a: English abilities (Galvez-Soriano, 2023)

Data

- I use the 2014 Subjective Well-being Survey (BIARE)
- Representative at national and state level
- Asks if the respondent speaks English
- Only 3% reported they speak English

Empirical strategy

Take advantage of state policy changes in English instruction

$$y_{isc} = \theta + \psi \cdot HadPolicy_{sc} + \delta_s + \kappa_c + \mathbf{X}_{isc}\Psi + \varepsilon_{isc}$$

where $HadPolicy_{sc}$ takes the value of one if individual i lives in a treated state and he/she belongs to one of the affected cohorts (zero otherwise) ▶▶ PTA

Mechanism 1a: English abilities (Galvez-Soriano, 2023)

Table: Intention to Treat effect of offering English instruction at school (SDD estimate)

	(1)	(2)
	Hrs	Speak
	Eng	Eng
<i>Panel A: Full sample</i>		
Had Policy	0.308*** (0.046)	0.015** (0.008)
Observations	13,131	13,131
Adjusted R^2	0.596	0.075

Mechanism 1b: Workers moving to jobs requiring English skills

- Same social security data I use in the labor market analysis
- Use BIARE to I construct an index of economic industries by English skills
 - According to the NAICS at four-digit code
- For each manufacturing and services, I form dummy variables indicating if job requires English
 - Dummy for high-English manufacturing jobs indicating industries with more than 8% of English speakers
 - Dummy for low-English manufacturing jobs indicating industries with less than 8% of English speakers
 - Similarly for services

English skills

Table 6: Exposure to English instruction and economic industries (Social Security data)

	(1)	(2)	(3)	(4)
	Manufacturing		Services	
	High English	Low English	High English	Low English
<i>Panel B: Low enrollment sample</i>				
Hrs English	0.060*** (0.013)	-0.026** (0.012)	0.046*** (0.014)	-0.039*** (0.011)
Observations	259,666	259,666	259,666	259,666
Adjusted R^2	0.175	0.189	0.145	0.116

Robustness Checks

- Concern about TWFE estimator in the presence of heterogeneous treatment effects ▶ TWFE
- Concern about differential cohort trends across labor markets ▶ State by cohort
- Different exposure variable ▶ Exposure
- Different enrollment thresholds ▶ Threshold ▶ Test scores
- No-changes in private school enrollment ▶ Private enrollment
- No-effects on other resources ▶ Teachers

Discussion

- Exposure to English instruction in Mexican primary schools
 - Has, on average, no significant effect on wages
 - But positive returns among high-achieving kids
 - Across industries: shifts workers out of agriculture and construction
 - Within industries: shifts workers to jobs requiring English abilities
- Consistent with English skills mediating these effects of English instruction
 - Evidence from previous state English programs (Galvez-Soriano, 2022)
 - No effect on other cognitive skills

Data: Student achievement

- 1 I look at test scores as one of the mechanisms
- 2 I standardize test scores, ts_{isct} , of each student i in school s at time t using the following formula:

$$test_score_{isc} = \frac{ts_{isct} - \mu_t}{\sigma_t}$$

where $test_score_{isc}$ is the standardized test score, while μ_t and σ_t are the mean and standard deviation of test scores, respectively, pooling all Mexican students by grade and by each observed year

Gender heterogeneous effects

- Increase in mobility is driven by women » Labor mkt
 - Women move away from rural areas » Industries
- Positive effect on wages is driven by men » High achieving
 - High achieving men substitute proportionally more agricultural than construction jobs for manufacturing ones » Abilities

Wages in IMSS data [» Back](#)

The social security data has a monthly frequency, and each month could have more than one observation for the same worker because some workers have more than one job

- 1 I take the average of the wages reported over one year, by worker, by economic sector and by employer
- 2 When a worker has multiple jobs, I drop the jobs with the lowest wages if those are non-permanent jobs
- 3 If there are individuals with permanent and non-permanent jobs, I only use permanent jobs
- 4 For individuals who have more than one job with the same wage I choose the job in which they have worked most part of the year

I assume that an employee works 30 days, on average

Where did you learn English? [▶▶ Back](#)

Note: This question was answered only by individuals who reported having English abilities. The answers are independent, i.e. do not sum 100 percent.
